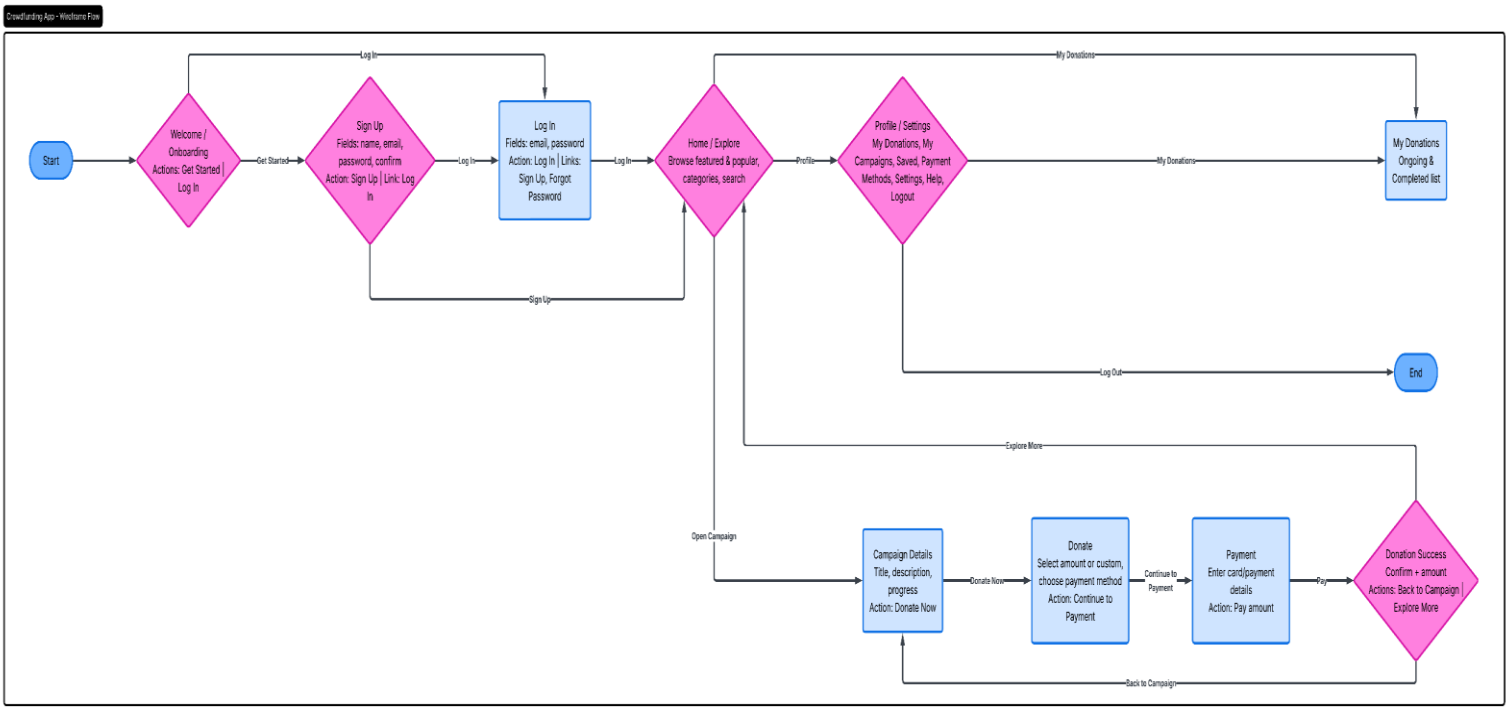
EXPERIMENT 5: Task Analysis & User Flow Documentation

NAME:MOHAMED ASEEL

ROLL NO:240701319



Objective: Conduct task analysis for a crowdfunding app and document user flows. Create corresponding wireframes.

Screen 1: Welcome / Onboarding
User lands on app. Options: Get Started or Log In.

Screen 2: Sign Up / Log In
User enters email & password. Options for sign up, login, forgot password.

Screen 3: Home / Explore
User browses campaigns, categories, and search.

Screen 4: Campaign Details
Shows campaign title, description, and progress. Option to donate.

Screen 5: Donate
User selects amount and payment method.

Screen 6: Payment
User enters payment details and confirms.

Screen 7: Donation Success
Confirmation of donation with options to explore more.

Screen 8: Profile / Settings

User manages campaigns, donations, and account settings.

Flow Description:

• User starts at onboarding and proceeds to login/signup.

• After authentication, user enters Home/Explore.

• User selects a campaign → views details → donates.

• Payment is processed → success confirmation shown.

• User can view donations in profile or explore more.

Conclusion:

- Through this experiment, a clear understanding of task analysis and user flow design was achieved by studying and structuring the workflow of a crowdfunding application. The process involved identifying key user actions such as onboarding, authentication, browsing campaigns, making donations, and managing user profiles. By breaking down these tasks step-by-step, it became easier to visualize how users interact with the system and how each screen connects logically.
- Designing the user flow diagram helped in mapping the complete journey of the user, from entering the application to successfully completing a donation. It also highlighted important decision points, such as login validation and payment processing, ensuring that all possible user paths were considered. This improves both usability and efficiency of the application.
- Furthermore, creating wireframes provided a basic visual representation of each screen, focusing on layout, navigation, and functionality rather than detailed design. This step is crucial in the development process as it allows designers and developers to identify potential issues early and refine the user experience before implementation.
- Overall, this experiment demonstrated the importance of structured planning in application development. Task analysis and user flow documentation play a vital role in creating intuitive, user-friendly interfaces. By using tools like Lucidchart, complex workflows can be simplified and effectively communicated, leading to better design decisions and improved user satisfaction.
